**Features and Benefits**

- Rotary Position Gear Tooth Sensor
- Short Circuit Protection
- On-chip 10 bit A/D Converter
- Self-Adjusting Magnetic Range
- High Speed Operation
- No Chopper Delay
- Zero Speed Detection
- No Rotary Orientation Concerns

**Applications**

- Camshaft Sensor
- Geartooth Sensor
- Linear Encoder
- Rotary Encoder
- Direction Detection*

*See applications example

**Description**

The MLX90217 is a self adjusting digital output rotary position gear tooth sensor designed for use in automotive camshaft sensing as well as other speed sensing applications. It is designed to be used with a bias magnet south facing the back (non-marked) side of the IC. The device has an open collector output which is short circuit protected.

The MLX90217 is a sophisticated IC featuring an on-chip 10-bit A/D Converter and logic that acts as a digital sample and hold circuit. A separate 4-bit A/D converter provides a fixed hysteresis. The 90217 does not have a chopper delay. The 90217 uses a single Hall plate which is immune to rotary alignment problems. The bias magnet can be from 50 to 400mT.

As the signal is sampled, the logic recognizes an increasing or decreasing flux density. The output will turn on (BOP) after the flux has reached its peak and decreased by an amount equal to the hysteresis. Similarly the output will turn off (BOP) after the flux has reached its minimum value and increased by an amount equal to the hysteresis.
### MLX90217 Electrical Specifications

DC Operating Parameters $T_A = -40^\circ C$ to $150^\circ C$, $V_{DD} = 3.5V$ to 24V (unless otherwise specified).

**Absolute Maximum Ratings**

- Supply Voltage (Operating), \(V_{DD}\): 30V
- Supply Current (Fault), \(I_{DD}\): 50mA
- Output Current (Fault), \(I_{OUT}\): 30mA
- Output Current (Fault), \(I_{fault}\): 50mA
- Output Voltage, \(V_{OUT}\): 30V
- Power Dissipation, \(P_D\): 100mW
- Operating Temperature Range, \(T_A\): -40°C to 150°C
- Storage Temperature Range, \(T_S\): -65°C to 150°C
- Maximum Junction Temp, \(T_J\): 175°C
**Application Notes**

Maximum dynamic range is 500 mT. The hysteresis is fixed at 5.0 mT. Best angular accuracy will be obtained when the magnetic circuit provides peak magnetic flux at the chip near the high end of the linear range of 500 mT. EMC protection using external components are recommended. Two possibilities are shown on the following page. Normally the South pole faces the unbranded side of the device. A North pole will enable a test sequence used in factory testing.

**Unique Features**

The output is reset to the high state at power on (output driver is off) whatever the field is. The output only changes after the first min is detected. The reset state holds no information about the field. If the supply of the chip is raised slowly, the reset state is not stable. This has been observed at 0 field but it should be the same with small and large fields.

Gear tooth sensors often need to be adjusted after the module is assembled to align the magnet with differential Hall plates or orient with teeth. However the MLX90217 is “self adjusting” over a wide range of back bias flux eliminating the need for any trimming in the application. The magnet may be glued to the back surface (non branded side) of the IC using a cyanoacrylate adhesive or suitable epoxy.
Applications Examples

Edge Sensing (unidirectional)

Lobe Sensing (bidirectional)

Flux Concentration - Tooth Position

Flux Concentration - Valley Position

Recommended Wiring and Minimum Protection Circuit

Severe Environment and Automotive Protection Circuit

In severe cases it may be necessary to include a Zener diode to clamp positive interference and Schottky diodes to clamp negative excursions.

Reliability Information

This Melexis device is classified and qualified regarding soldering technology, solderability and moisture sensitivity level, as defined in this specification, according to following test methods:

- **IPC/JEDEC J-STD-020**
  Moisture/Reflow Sensitivity Classification For Nonhermetic Solid State Surface Mount Devices
  (classification reflow profiles according to table 5-2)

- **EIA/JEDEC JESD22-A113**
  Preconditioning of Nonhermetic Surface Mount Devices Prior to Reliability Testing
  (reflow profiles according to table 2)

- **CECC00802**
  Standard Method For The Specification of Surface Mounting Components (SMDs) of Assessed Quality

- **EIA/JEDEC JESD22-B106**
  Resistance to soldering temperature for through-hole mounted devices

- **EN60749-15**
  Resistance to soldering temperature for through-hole mounted devices

- **MIL 883 Method 2003 / EIA/JEDEC JESD22-B102**
  Solderability

For all soldering technologies deviating from above mentioned standard conditions (regarding peak temperature, temperature gradient, temperature profile etc) additional classification and qualification tests have to be agreed upon with Melexis.

The application of Wave Soldering for SMD’s is allowed only after consulting Melexis regarding assurance of adhesive strength between device and board.

Based on Melexis commitment to environmental responsibility, European legislation (Directive on the Restriction of the Use of Certain Hazardous substances, RoHS) and customer requests, Melexis has installed a Roadmap to qualify their package families for lead free processes also.

Various lead free generic qualifications are running, current results on request.

For more information on manufacturability/solderability see quality page at our website:

ESD Procautions

Electronic semiconductor products are sensitive to Electro Static Discharge (ESD). Always observe Electro Static Discharge control procedures whenever handling semiconductor products.
